

IN THE CLAIMS

Please amend claims 8-11, 13, and 14, as shown in the complete list of claims that is presented below.

Claims 1 - 7 (canceled)

8. (currently amended) An organic electroluminescent display, comprising:

(a) an organic light-emitting device including, in the recited sequence,

a substrate,

thin film transistors that each have a source and a drain,

anodes or cathodes that include an electrically conductive thin film

material and are each connected to the source or the drain on a corresponding one of the thin film transistors,

an organic electroluminescent light-emitting layer,

an upper transparent electrode that is a cathode or anode and includes a transparent electrically conductive material, and

at least one passivation layer on the upper transparent ~~electrode~~, electrode;

~~and which is driven by the thin film transistors;~~

(b) a color-converting substrate that comprises

a transparent supporting substrate, and

color-converting filters that comprise color filter layers alone, or color

filter layers and color-converting layers, and are ~~formed~~ disposed on the

supporting substrate, the color-converting filters having edges;

(c) ~~[[an]]~~ adhesive ~~layer~~ that disposed is between the organic light-emitting device and the color-converting filters, and that bonds the organic light-emitting device and the color-converting filters together with the color-converting filters facing the upper transparent electrode of the organic light-emitting device; and

(d) a stress-relieving layer that is disposed between the organic light-emitting device and the color-converting filters, ~~[[and]]~~ the stress-relieving layer being patterned to have walls that are disposed at the edges of the color-converting filters and to have openings between the walls, the adhesive extending into the openings.

9. (currently amended) The organic electroluminescent display according to claim 8, wherein the stress-relieving layer includes a resin having a higher elasticity than the adhesive ~~layer.~~

10. (currently amended) The organic electroluminescent display according to claim 8, wherein the stress-relieving layer has a lower refractive index than the adhesive ~~layer.~~

11. (currently amended) The organic electroluminescent display according to claim 8, wherein walls of the stress-relieving layer ~~[[has]]~~ have a reverse tapered shape relative to the color filter layers alone, or the color filter layers and the color-converting layers, of the color-converting filters.

12. (previously presented) The organic electroluminescent display according to claim 8, wherein the stress-relieving layer is black.

13. (currently amended) The organic electroluminescent display according to claim 8, wherein the stress-relieving layer ~~is an efficient~~ has fine particles dispersed therein that promote thermal conductor. conductivity.

14. (currently amended) The organic electroluminescent display according to claim [[13]] 8, wherein the stress-relieving layer is formed from a polymeric material having ~~an efficient thermal conductor~~ fine carbon particles dispersed therein to promote thermal conductivity.
